Vector addition systems

- $G = (x, W), x \in \mathbb{N}^n, W \subseteq \mathbb{Z}^n$
- Reachability set $R(G) = \{z \mid \exists v_1 \dots v_j \in W : z = x + v_1 + \dots + v_j \text{ and } \forall 1 \leq i \leq j : x + v_1 + \dots + v_i \geq 0\}$
- Same reachability set as Petri nets

P system with active membranes

- $\Pi = (\Sigma, C_0, R_1, \dots, R_m)$
- $C = (T, I, c)$
 - $I : V(T) \rightarrow \{1, \dots, m\}$
 - $c : V(T) \rightarrow \mathbb{N}^\Sigma$
- Rewriting rules
 - $u \rightarrow v$
 - $u \rightarrow v\delta$
 - $u \rightarrow [{}_j v]_j$, where $u \in \mathbb{N}^\Sigma, |u| \geq 1$ and $v \in \mathbb{N}^{\Sigma \times \{\uparrow, \downarrow\}}$

Termination problems

- Halting problem
- Existence of (in)finite computation
- Reachability graph
- Two conditions:
 - $C_1 \leq C_2 \Rightarrow$ each transition in C_1 can be fired in C_2
 - for each infinite computation there is C_1, C_2 , such that $C_1 \rightarrow^* C_2$ and $C_1 \leq C_2$
- Dickson's lemma: For every infinite sequence of tuples over $\mathbb{N} \{a_i\}_{i=0}^\infty$ there are $i < j$ such that $a_i \leq a_j$

Michal Kováč

Decidability of Termination Problems for Sequential P Systems w

Termination problems in active membranes

- How to use Dickson's lemma for active membranes?
- Idea: encode configuration to k-tuple maintaining two conditions

Definition

$C_1 = (T_1, h_1, c_1) \leq C_2 = (T_2, h_2, c_2) \Leftrightarrow$
 \exists isomorphism $f : T_1 \rightarrow T_2$ such that $\forall d \in V(T_1) :$

- $h_1(d) = h_2(f(d))$
- $c_1(d) \subseteq c_2(f(d))$

Lemma

$C_1 = (T_1, h_1, c_1) \leq C_2 = (T_2, h_2, c_2) \Rightarrow \exists$ isomorphism $f : T_1 \rightarrow T_2$
such that rule r is applicable in $d \in T_1 \Rightarrow r$ is applicable in $f(d)$.

Termination problems in active membranes

Theorem

Existence of infinite computation in sequential P systems with active membranes is decidable.

Theorem

Existence of finite computation in sequential P systems with active membranes is decidable.

Proof.

Reduction to reachability of register machines. \square

Decidability of Termination Problems for Sequential P Systems w

Termination problems in active membranes

Definition

Define $enc(C)$ as k-tuple satisfying
 $enc(C_1) \leq enc(C_2) \Rightarrow C_1 \leq C_2$.

Lemma

For every infinite computation there is $i < j$ such that $C_i \leq C_j$.

Proof.

Assume infinite sequence $\{enc(C_i)\}_{i=0}^{\infty}$. From Dickson's lemma there is $i < j$ such that $enc(C_i) \leq enc(C_j)$. Our property of enc implies $C_i \leq C_j$. \square
